

INFOLUTION

SOLVING INFORMATION COMPLEXITY

PRESS RELEASE

Web 3.0 – Thought Leadership And Innovation Displayed At The Netherlands Pavilion At CeBIT

New Leading Edge Semantic Technology Solutions Enable Users To Solve Information Complexity

Hannover/Germany – March 4, 2008. Today Infolution, one of the most advanced pioneers in semantic technologies, introduces its latest search and retrieval solutions at CeBIT. The new solutions are helping enterprises, web companies and public sector organisations to dramatically improve the way they go about

- Research,
- Archiving,
- Enterprise Search and
- Web Search and Retrieval.

All four solutions are based on a powerful semantic search engine for data collection, analysis, storage and retrieval, and access control. The solutions are applicable to structured and unstructured text data and provide functionalities including innovative search functionality, automatic document classification and document summaries.

Users benefit by retrieving relevant search information effectively and efficiently with high accuracy, without being distracted by irrelevant data. The software enables knowledge sharing, saves time and reduces the risk of overlooking important knowledge, ultimately allowing faster decision making and increased productivity.

Infolution's software will contribute significantly to enabling the elevation of the Internet to the next level. After the transformation to the interactive Internet (Web 2.0), the next wave (Web 3.0) will be driven by semantic technologies allowing for data, information and knowledge exchange.

About Infolution:

Infolution is a multiple award winning provider of Web 3.0 Search and Retrieval Technologies. The company is headquartered in Grootebroek, the Netherlands, and is represented in the US, the UK and in Germany via partners. The company supports more than 200 customers across enterprises, web companies and public sector organisations. Infolution was established in 2001 and is privately held. Founder and Managing Director is Henk Allen, a widely respected authority in the area of semantic technologies.
